

ITEP 414 – SYSTEM ADMINISTRATION AND MAINTENANCE

Name: Parado, Czeanne P.

Section: BSIT 4E

PART I. INSTALLATION GUIDE

Virtual Machine Specifications

Component	Configuration
Name	Ubuntu-Server-Week03
RAM	4 GB
CPU	2 Virtual Processors
Storage	40 GB (VDI/VMDK)
Network	NAT
Optical Drive	Ubuntu Server LTS ISO

Installation Steps

1. Language – Selected English as the installation language.
2. Keyboard Layout – Selected English (US) as the keyboard layout, matching the standard configuration for the workstation.
3. Network Configuration – Accepted the default DHCP configuration, which automatically assigned an IP address to the server. The assigned IP was recorded for later verification (e.g., 192.168.x.x, replace with your actual address from the ip addr output).
4. Hostname – Set the system hostname to server01, identifying this machine within the network as the company's first deployed Linux server.
5. User Account – Created a non-root administrative user account for day-to-day server management, following the principle of least privilege rather than operating as root directly:
 - Full Name: [Your Name]
 - Username: [yourlastname]
 - Password: Strong password set during setup
6. Disk Partition – Selected Guided – Use Entire Disk for partitioning. This automatically allocated the full 40 GB virtual disk using the ext4 filesystem with a standard LVM (Logical Volume Manager) layout, which included:
 - A /boot partition
 - An LVM physical volume containing the root (/) logical volume
 - Swap space for memory management
7. SSH Server – Enabled the Install OpenSSH Server option during setup, allowing secure remote administration of the server via SSH immediately after installation completes — a requirement for enterprise servers that are typically managed headlessly.
8. Additional Packages – No additional packages (e.g., Docker, LAMP stack) were installed at this stage, per the instructions to keep the base installation minimal and add packages only when instructed.
9. Complete Installation – Once configuration was finished, the installer completed the setup, prompted for the ISO to be removed, and the virtual machine was restarted to boot into the newly installed Ubuntu Server.
